How to install (Method A) [Recommended]:

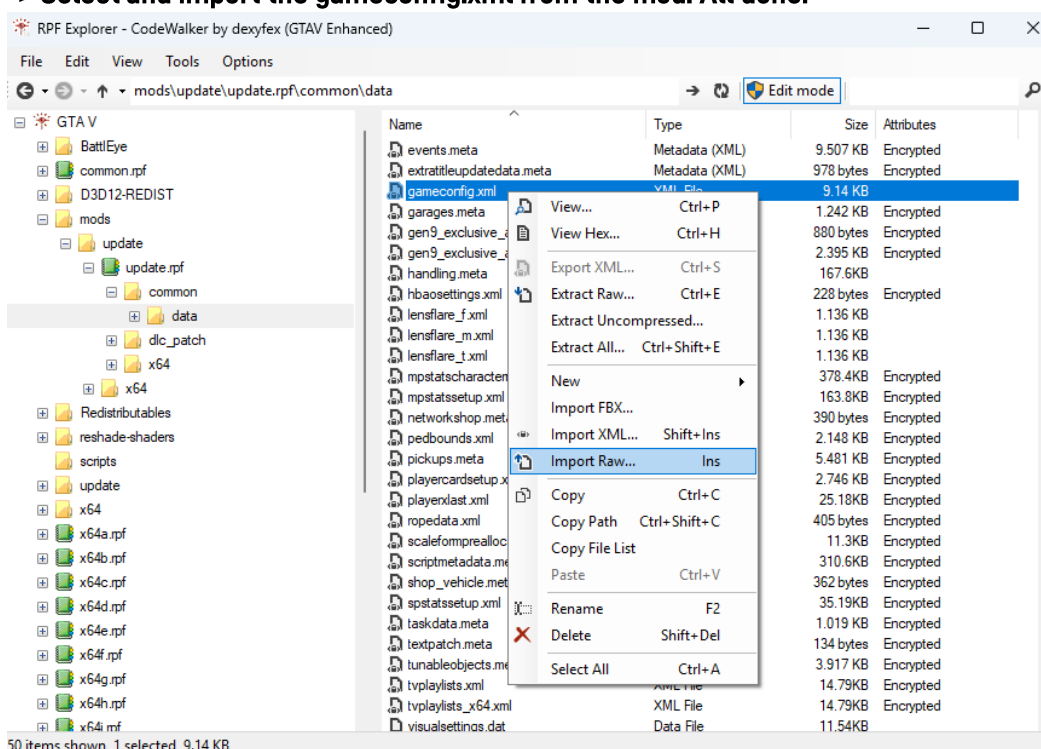

1. Delete dsound.dll, cachefix.asi and nocache.asi if you have them in your GTA 5 Enhanced folder
2. Download and install Script Hook:
<https://www.dev-c.com/gtav/scripthookv/>
3. Download and install OpenRPF, **DO NOT** install dsound.dll that comes with OpenRPF, only install OpenRPF.asi:
<https://www.gta5-mods.com/tools/openrpf-openiv-asi-for-gta-v-enhanced>
4. Copy **update/update.rpf** into the **mods/update** folder (If you have any mods installed, chances are you have update.rpf in the mods/update folder already, if so, you can skip this step)

5. Download dexyflex's CodeWalker and extract it somewhere on your computer:
v30_dev46: <https://www.gta5-mods.com/tools/codewalker-gtav-interactive-3d-map>
v30_dev48 (recommended): <https://gofile.io/d/p3oL3B>
6. Run **CodeWalker RPF Explorer.exe** and select your GTA 5 Enhanced folder

7. Enable **Edit mode**, then navigate to **mods\update\update.rpf\common\data** and right-click -> **Import Raw** -> **Select and import the gameconfig.xml from the mod. All done!**

How to install (Method B) [This method is for those who are using onigiri.asi to load modded files]:

Assuming you already have onigiri.asi installed, navigate to onigiri\common\data and place the gameconfig.xml from the mod in that folder, confirm replacement if asked by Windows *(If the folders don't exist, create them)*

Huge thanks to the [pnwparksfan gameconfig](#) for their awesome research.
